

## SEWING

- Slider spacing 8 cm ①
- A ripplefold must always have an **ODD** number of these slider spaces so that both curtain ends point to the rear ②.
- This results in curtain widths ③ in **INTERVALS** of 16 cm, see table.
- For split decorations, calculate the curtain width for each side separately.
- The overhang ④ at the end of the curtain cover the view of the curtain from the back and are included in the ready-sewn fabric widths. Add the fabric requirement for seams and hems.
- Sew the tape with a small header (max. 5 mm). Fix the position of the first marked loops depending on the fullness ⑤.

### NOTE:

Loop spacing 2 cm. Every 8th loop is marked for fullness 1:2.0 (100% fullness).

Tolerance in ripplefold 0,5 % (e. g.  $\pm 2.5$ cm at 500cm length)

### TIP:

Insert the hooks into the tape immediately after sewing. This will simplify hanging the ripplefold in situ.

③ Possible curtain widths	Number of slider spacings	Ready-sewn fabrics with fullness of:				
		1 : 1,5 (50% fullness)	1 : 1,75 (75% fullness)	1 : 2,0 (100% fullness)	1 : 2,25 (125% fullness)	1 : 2,5 (150% fullness)

## HOOKS

- Fit the hooks into the tape as shown depending on the fullness ⑤. Check the overhang at both ends of the curtain and insert two hooks for the end sliders.
- If the curtain has exactly the ready sewn fabric width shown in the table, all the hooks can be inserted at uniform intervals as shown. In the event of any differences, adjust the intervals between the hooks so that the corrugation depth only changes towards the rear.

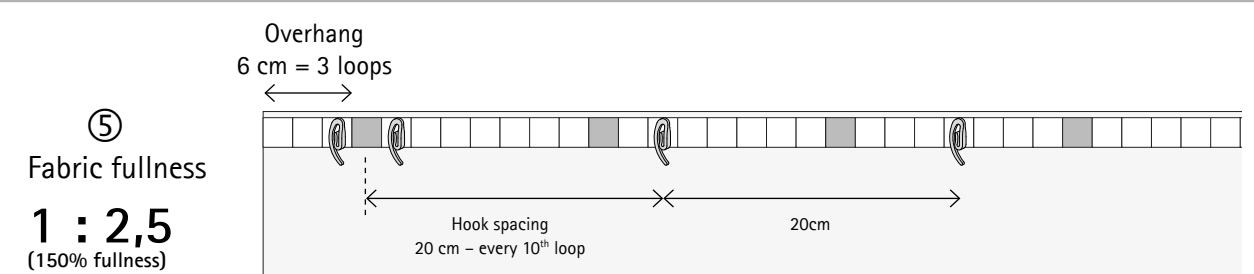

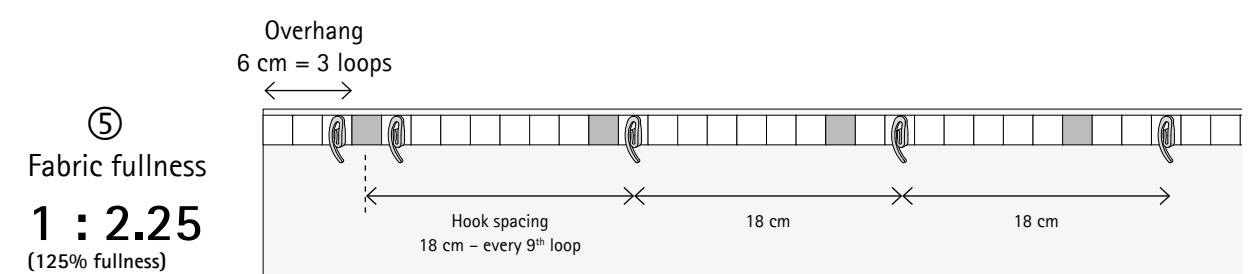

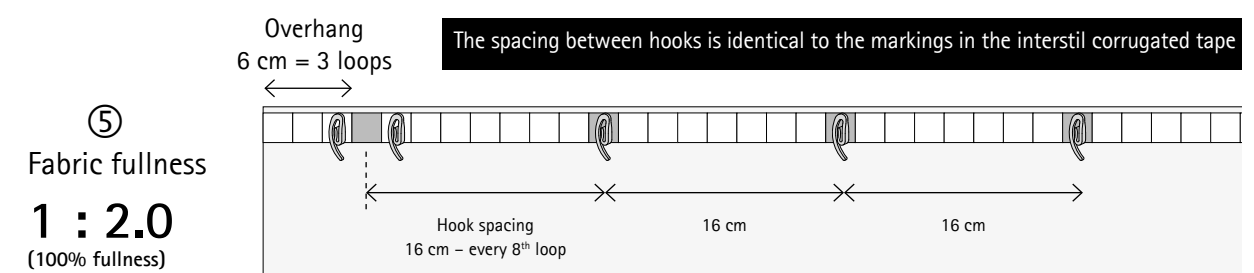

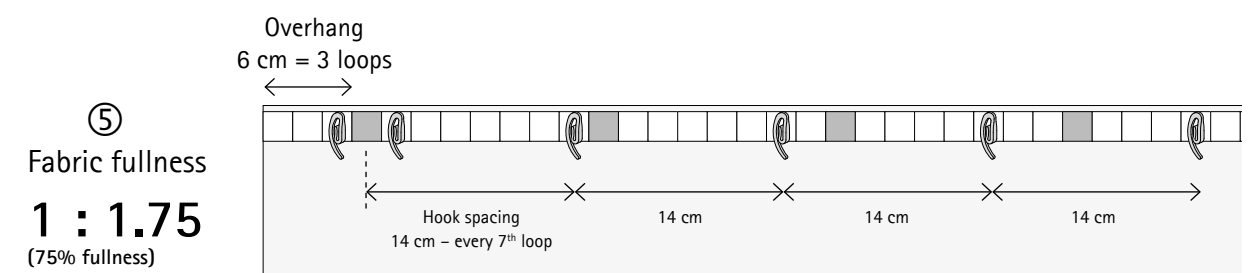

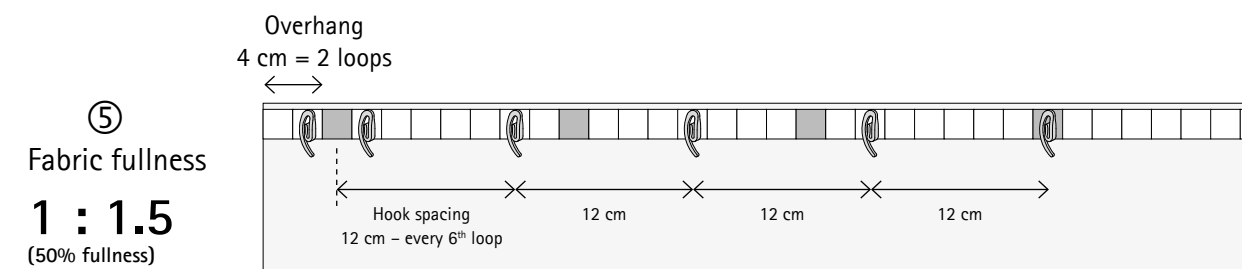

### CHECK:

The number of spacings between the hooks must be exactly the same as the number of slider spacings from the table.

### END SLIDERS

The end sliders are an integral component of every ripplefold set and hold the end of the curtain (overhang) with two hooks straight and at right-angles in relation to the rail for an attractive finish.
